Announcements

Stanford Graph Learning Workshop 2023

Stanford Data Science Affiliates Program

Register Now!

October 24 2023

<https://snap.stanford.edu/graphlearning-workshop-2023/>

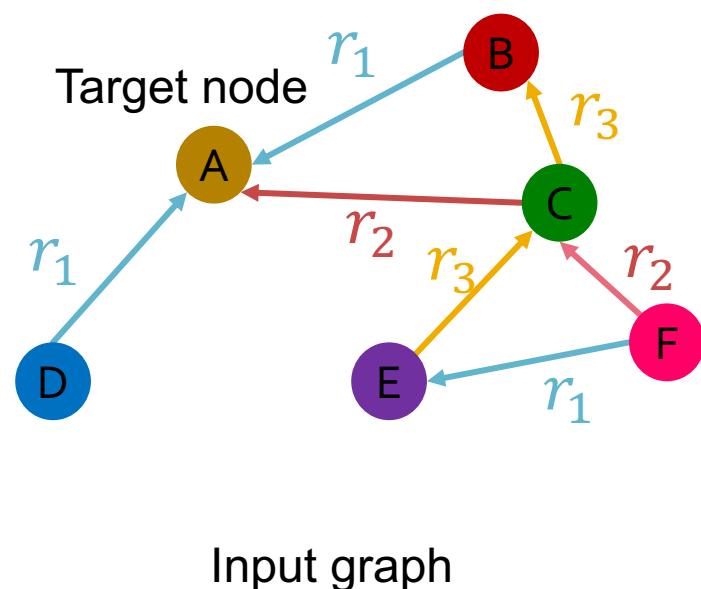

Feel free to join in person! Poster session will be great!

Announcements

- **Homework 1 due today**
 - Gradescope submissions close at 11:59 PM
- **Homework 2 will be released today by 9PM on our course website**
- **Homework 2:**
 - Due Thursday, 11/02 (2 weeks from now)
 - TAs will hold a recitation session for HW 2:
 - Time: Friday (10/27), 1-3pm
 - Location: Zoom, link will be posted on Ed
 - Session will be recorded

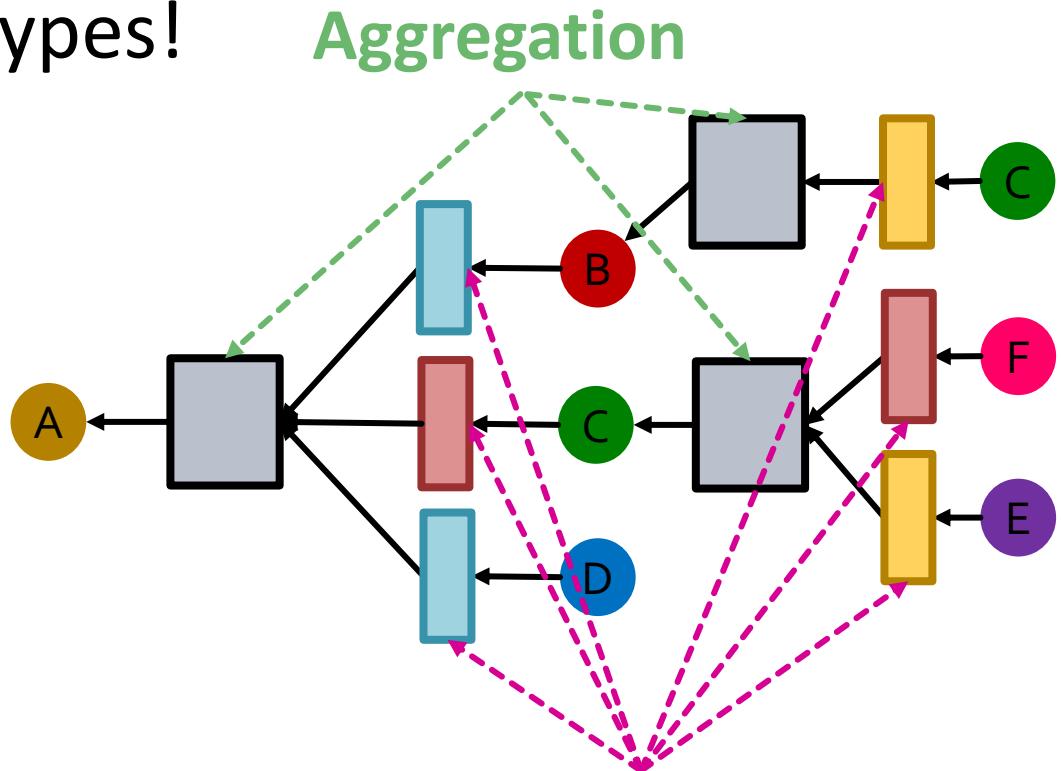

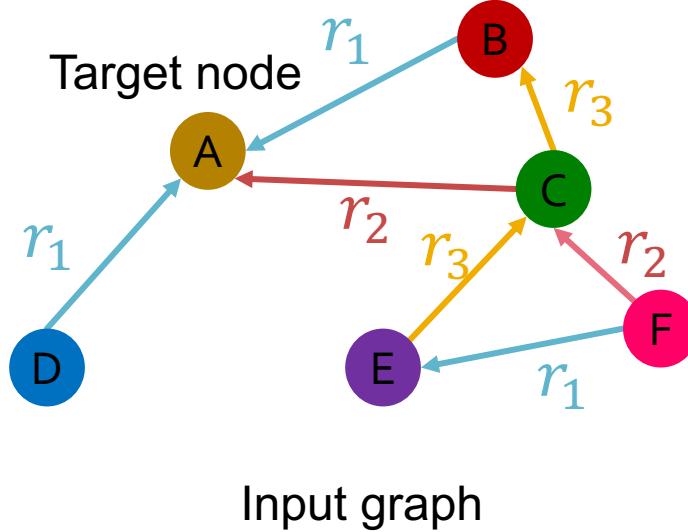

Recap: Heterogeneous Graphs

- Heterogeneous graphs: a graph with **multiple relation types**

Recap: Relational GCN

- Learn from a graph with **multiple relation types**
- Use different neural network weights for different relation types!

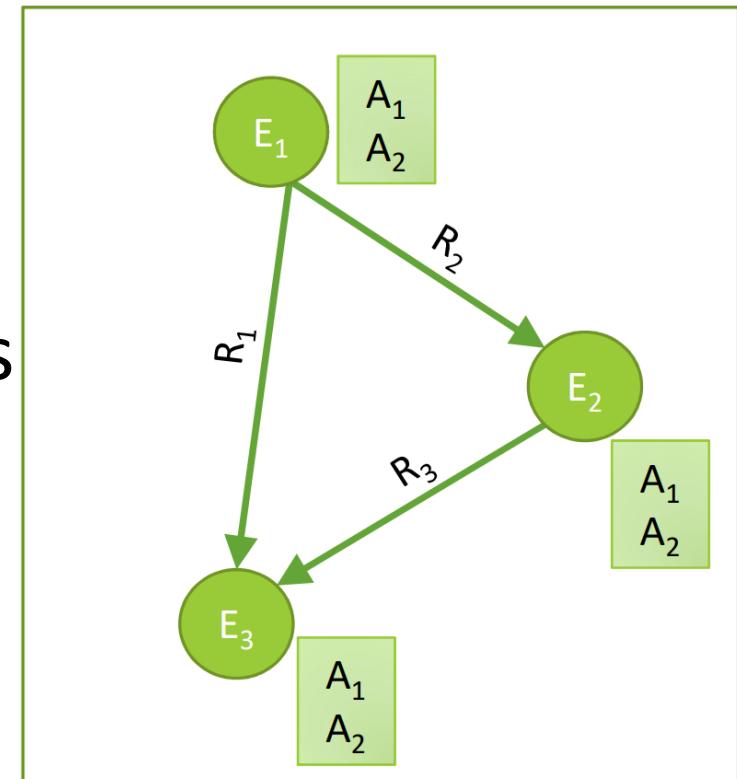

Neural networks

Today: Knowledge Graphs (KG)

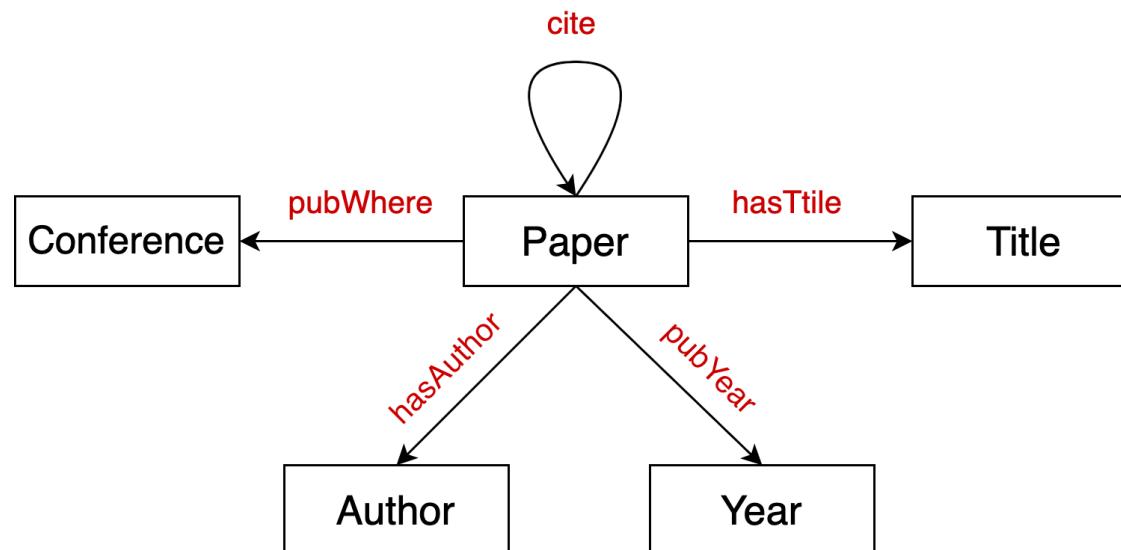

Knowledge in graph form:

- Capture entities, types, and relationships
- Nodes are **entities**
- Nodes are labeled with their **types**
- Edges between two nodes capture **relationships** between entities
- **KG is an example of a heterogeneous graph**

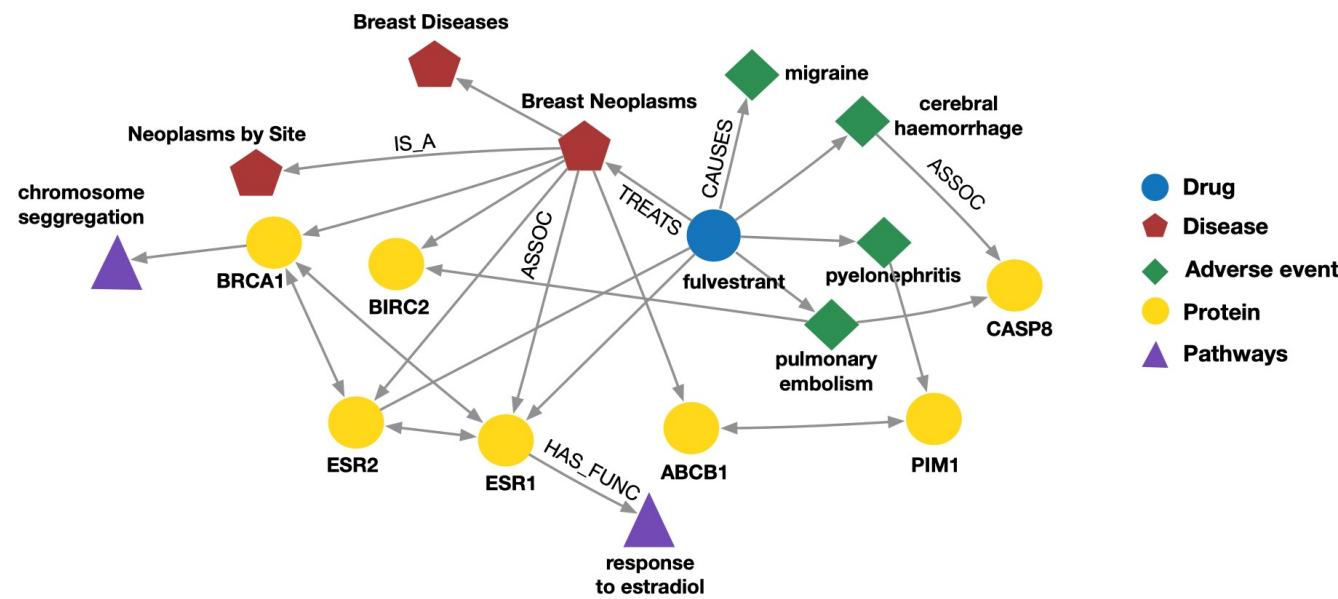

Example: Bibliographic Networks

- **Node types:** paper, title, author, conference, year
- **Relation types:** pubWhere, pubYear, hasTitle, hasAuthor, cite

Example: Bio Knowledge Graphs

- **Node types:** drug, disease, adverse event, protein, pathways
- **Relation types:** has_func, causes, assoc, treats, is_a

Knowledge Graphs in Practice

Examples of knowledge graphs

- Google Knowledge Graph
- Amazon Product Graph
- Facebook Graph API
- IBM Watson
- Microsoft Satori
- Project Hanover/Literome
- LinkedIn Knowledge Graph
- Yandex Object Answer

Applications of Knowledge Graphs

■ Serving information:

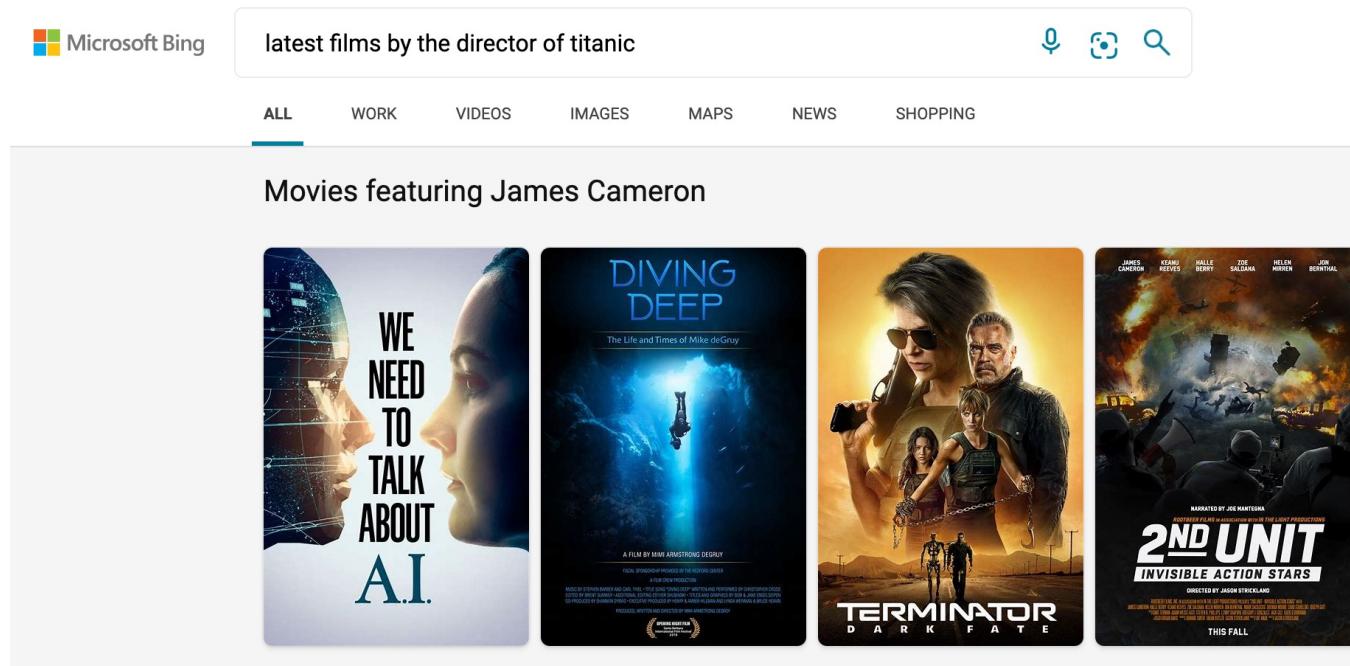

Image credit: Bing

Applications of Knowledge Graphs

■ Question answering and conversation agents

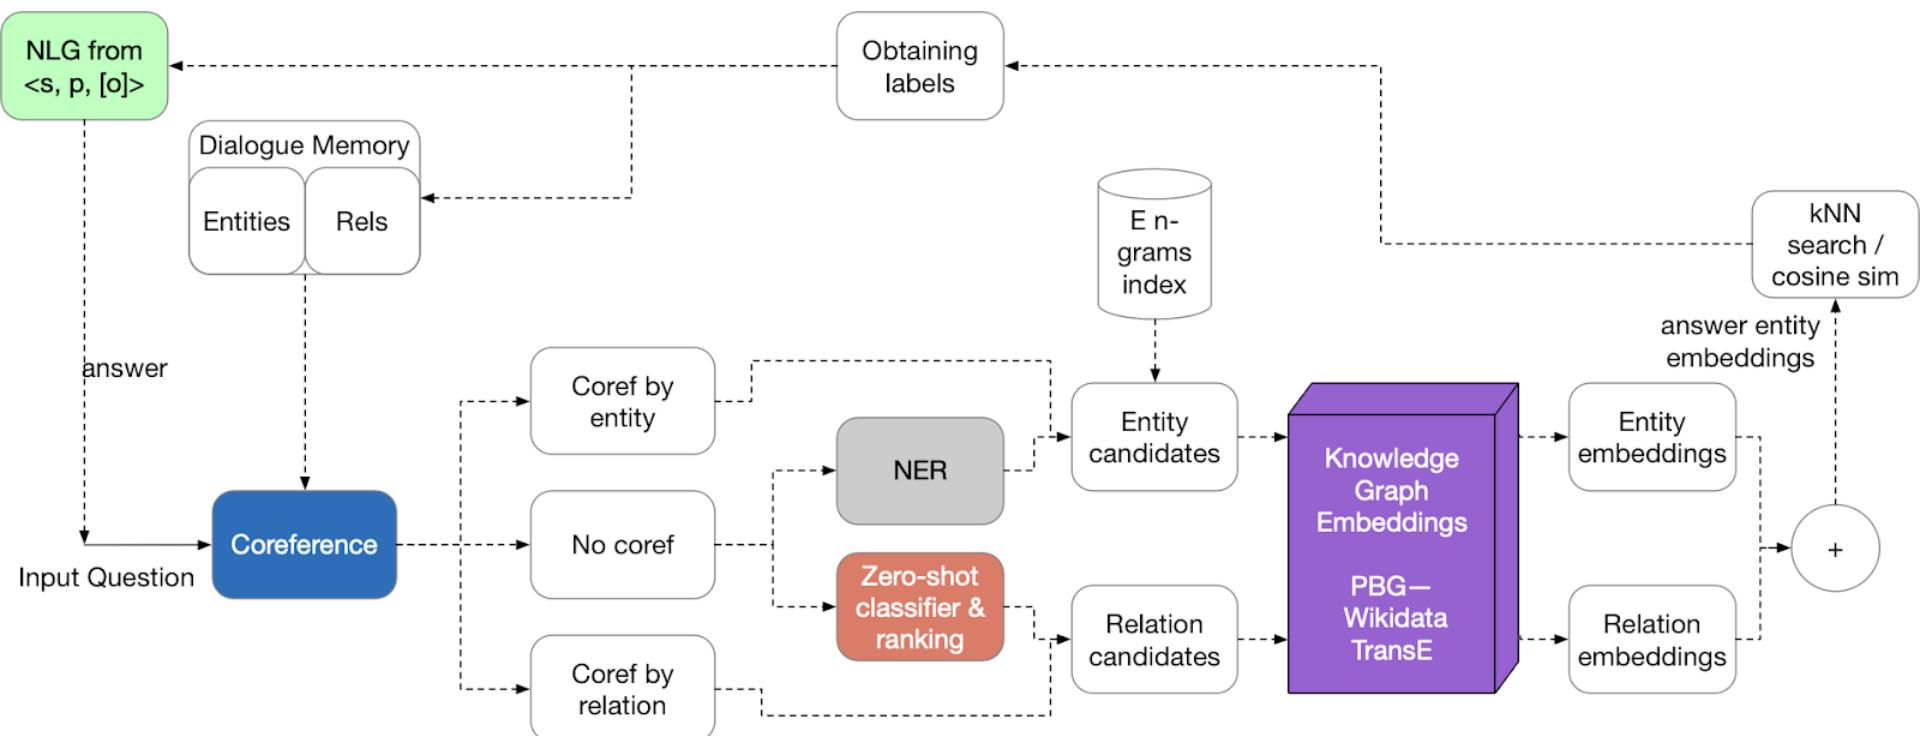

Image credit: [Medium](#)

Knowledge Graph Datasets

- **Publicly available KGs:**
 - FreeBase, Wikidata, Dbpedia, YAGO, NELL, etc.
- **Common characteristics:**
 - **Massive**: Millions of nodes and edges
 - **Incomplete**: Many true edges are missing

Given a massive KG,
enumerating all the
possible facts is
intractable!

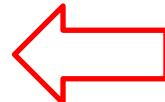

Can we predict plausible
BUT missing links?

Example: Freebase

■ Freebase

- ~80 million **entities**
- ~38K **relation types**
- ~3 billion **facts/triples**

93.8% of persons from Freebase have no place of birth and 78.5% have no nationality!

■ Datasets: FB15k/FB15k-237

- A **complete** subset of Freebase, used by researchers to learn KG models

Dataset	Entities	Relations	Total Edges
FB15k	14,951	1,345	592,213
FB15k-237	14,505	237	310,079

Stanford CS224W: Knowledge Graph Completion

CS224W: Machine Learning with Graphs

Jure Leskovec, Stanford University

<http://cs224w.stanford.edu>

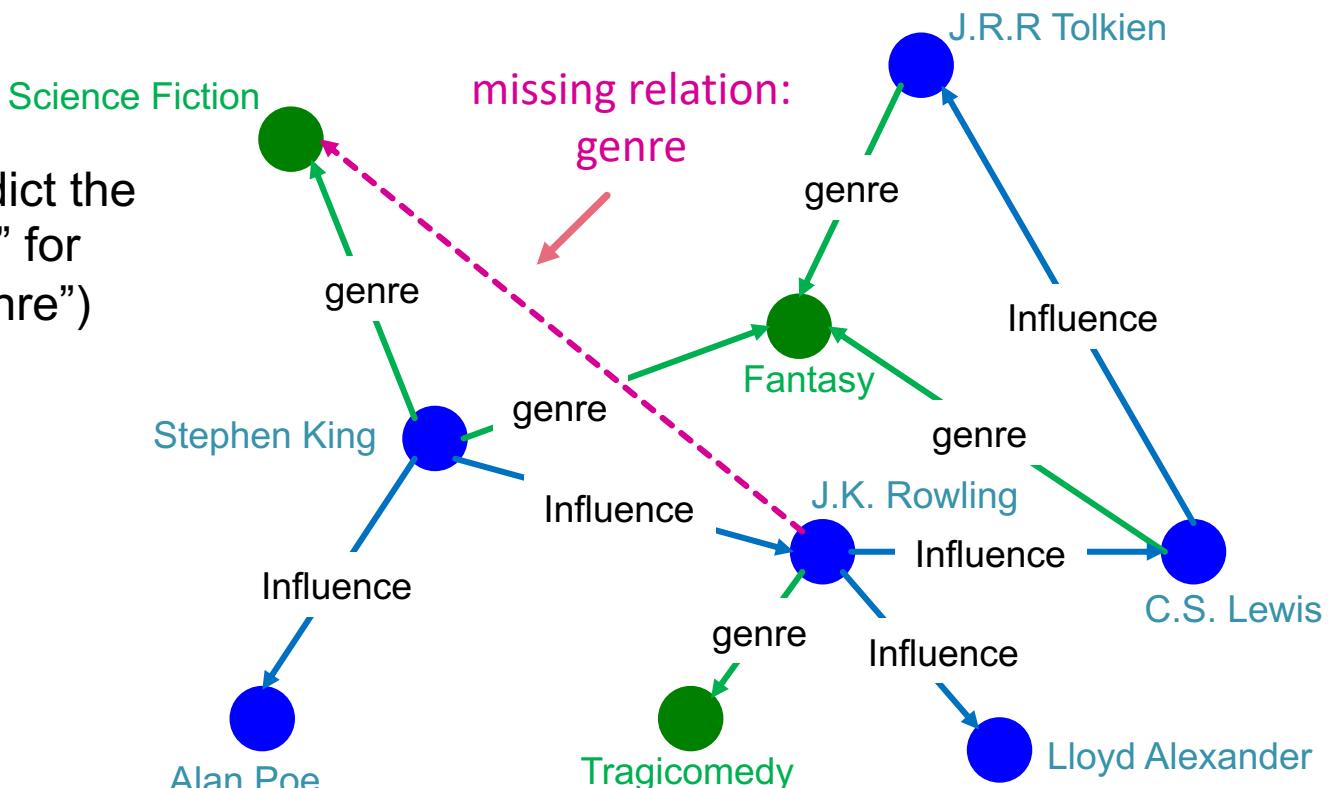

KG Completion Task

Given an enormous KG, can we complete the KG?

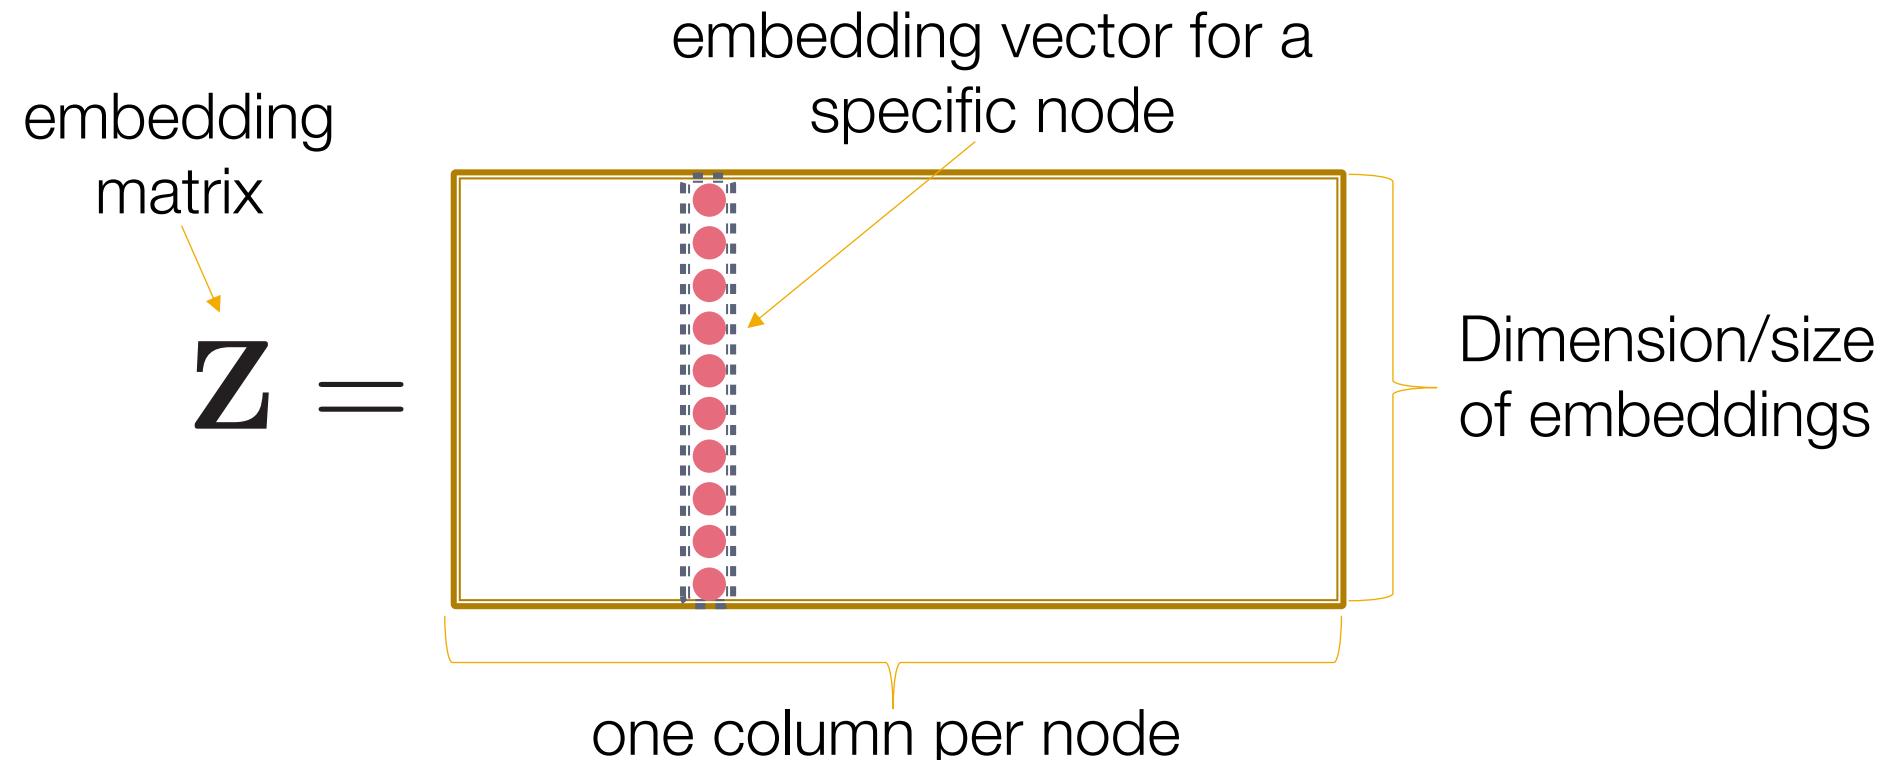

- For a given (**head**, **relation**), we predict missing **tails**.
 - (Note this is slightly different from link prediction task)

Example task: predict the tail “Science Fiction” for (“J.K. Rowling”, “genre”)

Recap: “Shallow” Encoding

- Simplest encoding approach: **encoder is just an embedding-lookup**

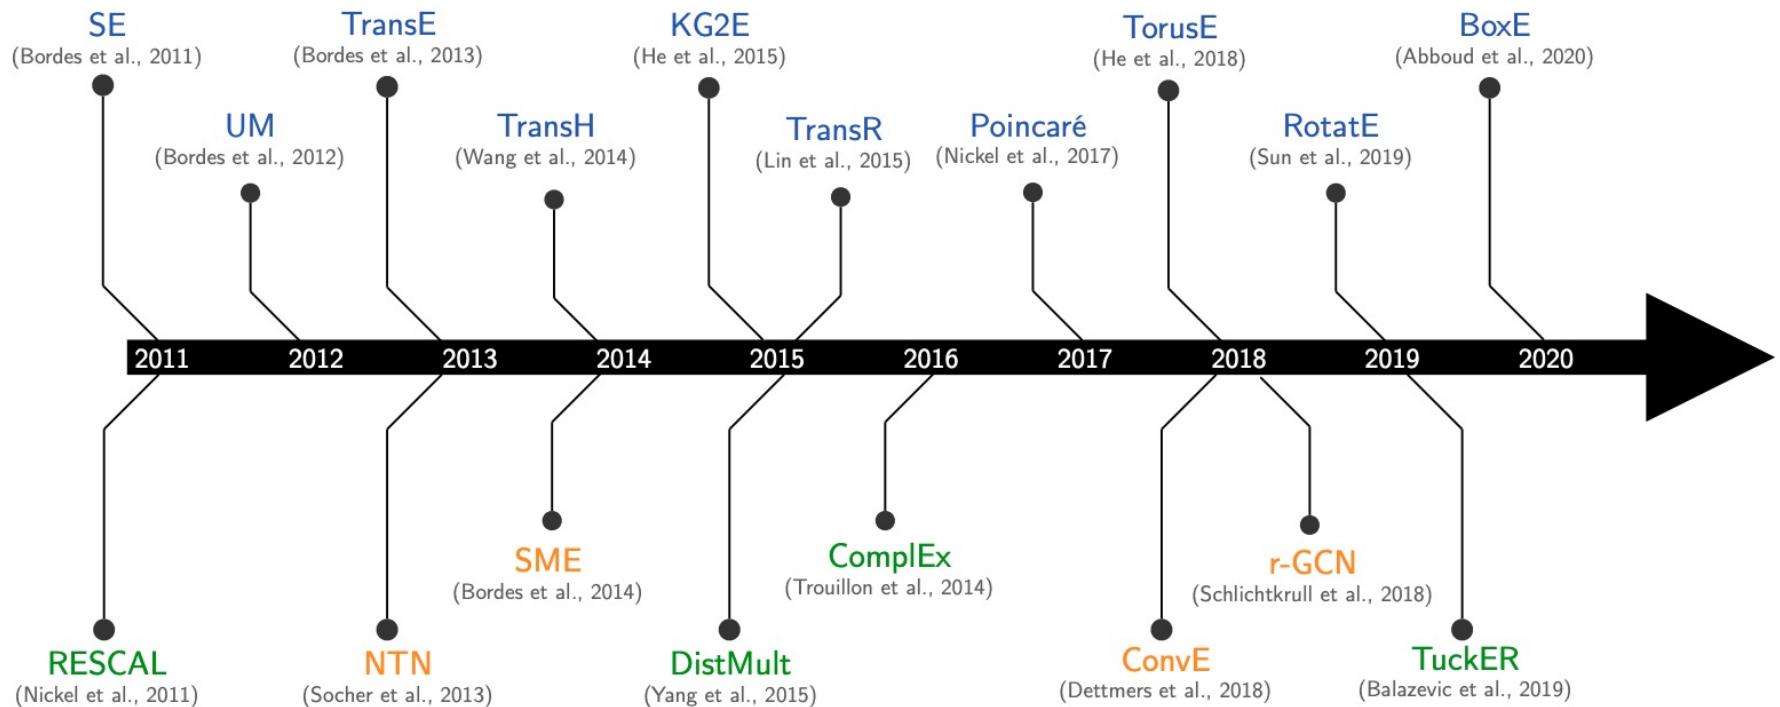

KG Representation

- Edges in KG are represented as **triples** (h, r, t)
 - head (h) has **relation** (r) with tail (t)
- **Key Idea:**
 - Model entities and relations in embedding space \mathbb{R}^d
 - Associate entities and relations with **shallow embeddings**
 - Note we do not learn a GNN here!
 - Given a triple (h, r, t) , the goal is that the **embedding of (h, r) should be close** to the **embedding of t** .
 - How to embed (h, r) ?
 - How to define score $f_r(h, t)$?
 - Score f_r is high if (h, r, t) exists, else f_r is low

Many KG Embedding Models

■ Many KG embedding Models:

Today: Different Models

We are going to learn about different KG embedding models (shallow/transductive embs):

- Different models are...
 - ...based on different geometric intuitions
 - ...capture different types of relations (have different expressivity)

Model	Score	Embedding	Sym.	Antisym.	Inv.	Compos.	1-to-N
TransE	$-\ \mathbf{h} + \mathbf{r} - \mathbf{t}\ $	$\mathbf{h}, \mathbf{t}, \mathbf{r} \in \mathbb{R}^k$	✗	✓	✓	✓	✗
TransR	$-\ M_r \mathbf{h} + \mathbf{r} - M_r \mathbf{t}\ $	$\mathbf{h}, \mathbf{t} \in \mathbb{R}^k,$ $\mathbf{r} \in \mathbb{R}^d,$ $M_r \in \mathbb{R}^{d \times k}$	✓	✓	✓	✓	✓
DistMult	$\langle \mathbf{h}, \mathbf{r}, \mathbf{t} \rangle$	$\mathbf{h}, \mathbf{t}, \mathbf{r} \in \mathbb{R}^k$	✓	✗	✗	✗	✓
ComplEx	$\text{Re}(\langle \mathbf{h}, \mathbf{r}, \bar{\mathbf{t}} \rangle)$	$\mathbf{h}, \mathbf{t}, \mathbf{r} \in \mathbb{C}^k$	✓	✓	✓	✗	✓

Stanford CS224W: Knowledge Graph Completion: TransE

CS224W: Machine Learning with Graphs

Jure Leskovec, Stanford University

<http://cs224w.stanford.edu>

TransE

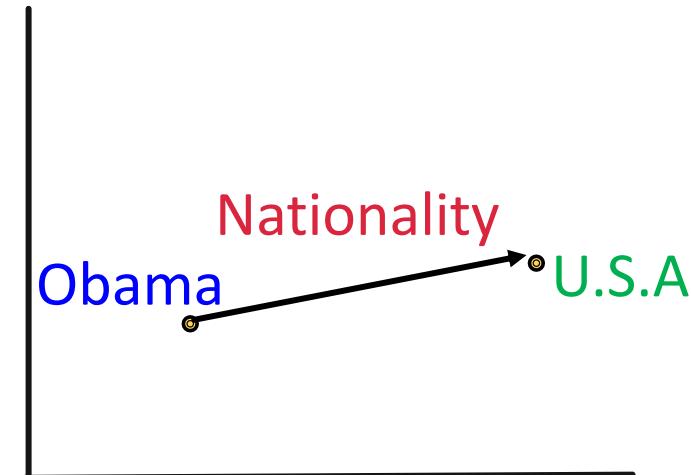

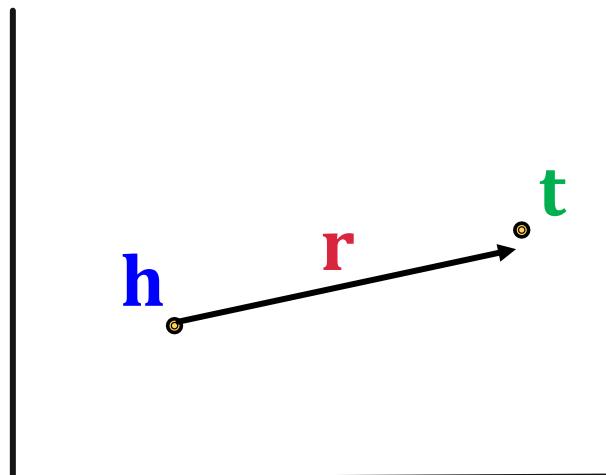

- **Intuition: Translation**

For a triple (h, r, t) , let $\mathbf{h}, \mathbf{r}, \mathbf{t} \in \mathbb{R}^d$
be embedding vectors.

embedding vectors
will appear in
boldface

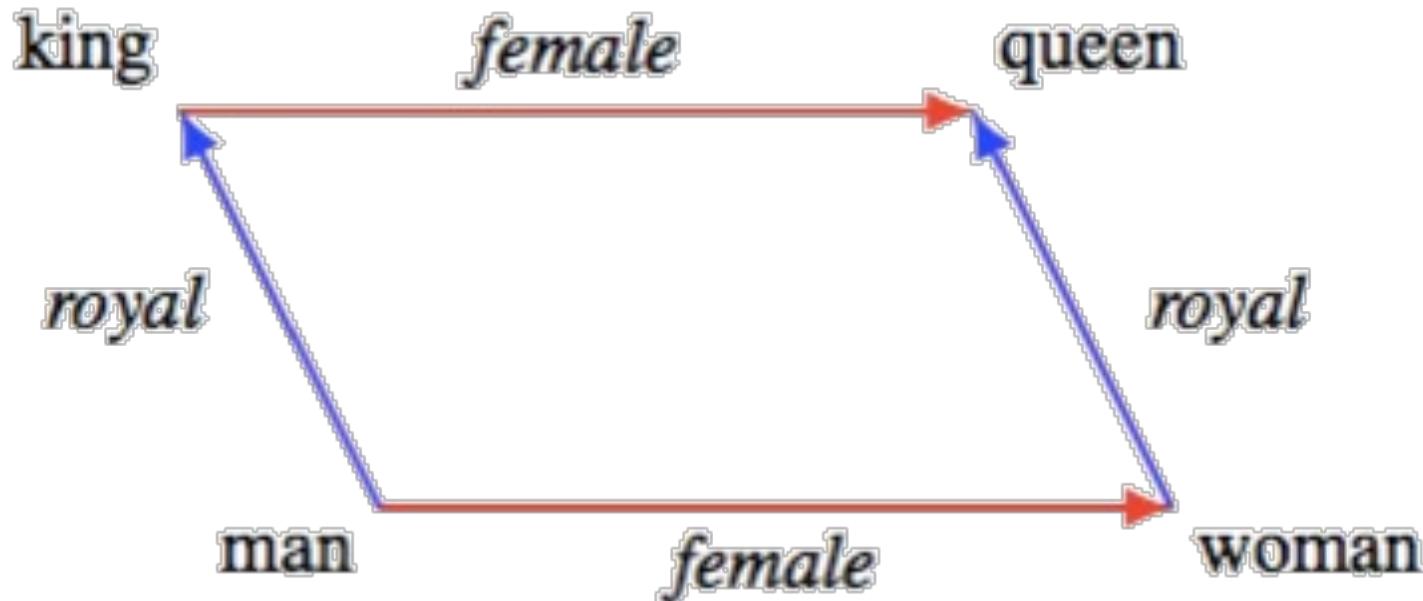

- **TransE:** $\mathbf{h} + \mathbf{r} \approx \mathbf{t}$ if the given link exists else $\mathbf{h} + \mathbf{r} \neq \mathbf{t}$

Entity scoring function: $f_r(h, t) = -||\mathbf{h} + \mathbf{r} - \mathbf{t}||$

TransE: Idea

- Entity embeddings

TransE: How to Learn

Algorithm 1 Learning TransE

input Training set $S = \{(h, r, t)\}$, entities and rel. sets E and R , margin γ , embeddings dim. k .

```

1: initialize  $r \leftarrow \text{uniform}(-\frac{6}{\sqrt{k}}, \frac{6}{\sqrt{k}})$  for each  $r \in R$ 
2:            $r \leftarrow r / \|r\|$  for each  $r \in R$ 
3:  $e \leftarrow \text{uniform}(-\frac{6}{\sqrt{k}}, \frac{6}{\sqrt{k}})$  for each entity  $e \in E$ 
4: loop
5:    $e \leftarrow e / \|e\|$  for each entity  $e \in E$ 
6:    $S_{batch} \leftarrow \text{sample}(S, b)$  // sample a minibatch of size  $b$ 
7:    $T_{batch} \leftarrow \emptyset$  // initialize the set of pairs of triplets
8:   for  $(h, r, t) \in S_{batch}$  do
9:      $(h', r, t') \leftarrow \text{sample}(S'_{(h, r, t)})$  // sample a corrupted triplet
10:     $T_{batch} \leftarrow T_{batch} \cup \{(h, r, t), (h', r, t')\}$ 
11:   end for
12:   Update embeddings w.r.t.
13: end loop
```

Initialize relations r and entities e uniformly, then normalize.
 γ is the margin.

Sample triplet (h', r, t) that does not appear in the KG.

d represents distance
(negative of score)

$$\sum_{((h, r, t), (h', r, t')) \in T_{batch}} \nabla [\gamma + d(\mathbf{h} + r, \mathbf{t}) - d(\mathbf{h}' + r, \mathbf{t}')]_+$$

positive sample negative sample

Contrastive loss: Favors lower distance (or higher score) for valid triplets, high distance (or lower score) for corrupted ones

Connectivity Patterns in KG

- Relations in a heterogeneous KG have different properties:
 - Example:
 - Symmetry: If the edge $(h, \text{"Roommate"}, t)$ exists in KG, then the edge $(t, \text{"Roommate"}, h)$ should also exist.
 - Inverse relation: If the edge $(h, \text{"Advisor"}, t)$ exists in KG, then the edge $(t, \text{"Advisee"}, h)$ should also exist.
- Can we categorize these relation patterns?
- Are KG embedding methods (e.g., TransE) expressive enough to model these patterns?

Four Relation Patterns

■ **Symmetric (Antisymmetric) Relations:**

$$r(h, t) \Rightarrow r(t, h) \quad (r(h, t) \Rightarrow \neg r(t, h)) \quad \forall h, t$$

- **Example:**

- Symmetric: Family, Roommate
 - Antisymmetric: Hypernym (a word with a broader meaning: poodle vs. dog)

■ **Inverse Relations:**

$$r_2(h, t) \Rightarrow r_1(t, h)$$

- **Example :** (Advisor, Advisee)

■ **Composition (Transitive) Relations:**

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

- **Example:** My mother's husband is my father.

■ **1-to-N relations:**

$r(h, t_1), r(h, t_2), \dots, r(h, t_n)$ are all True.

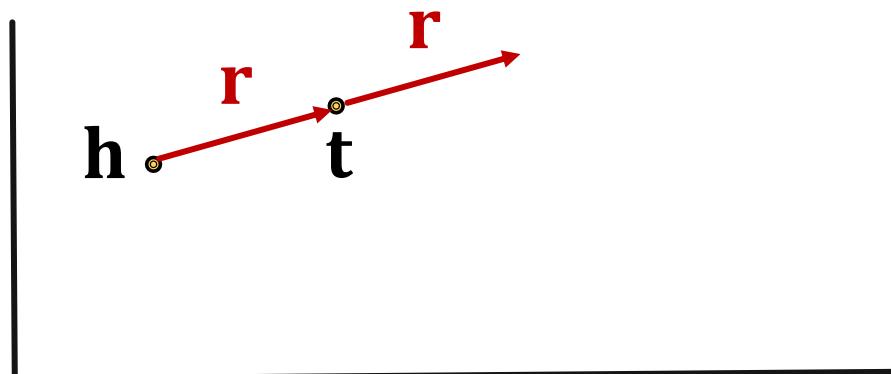

- **Example:** r is "StudentsOf"

Antisymmetric Relations in TransE

- **Antisymmetric Relations:**

$$r(h, t) \Rightarrow \neg r(t, h) \quad \forall h, t$$

- **Example:** Hypernym (a word with a broader meaning: poodle vs. dog)
- **TransE** can model antisymmetric relations ✓
- $\mathbf{h} + \mathbf{r} = \mathbf{t}$, but $\mathbf{t} + \mathbf{r} \neq \mathbf{h}$

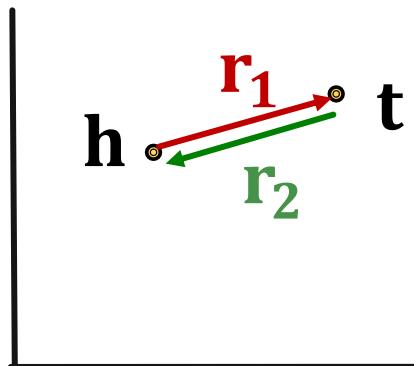

Inverse Relations in TransE

- Inverse Relations:

$$r_2(h, t) \Rightarrow r_1(t, h)$$

- Example : (Advisor, Advisee)
- TransE can model inverse relations ✓
- $h + r_2 = t$, we can set $r_1 = -r_2$

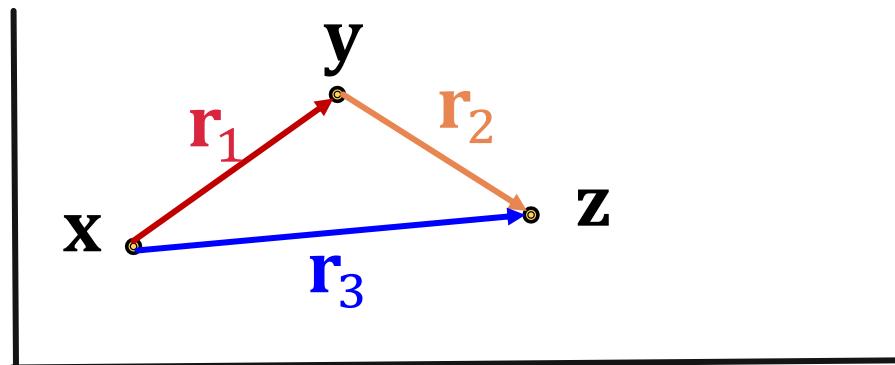

Composition in TransE

- **Composition (Transitive) Relations:**

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

- **Example:** My mother's husband is my father.
- **TransE** can model composition relations ✓

$$\mathbf{r}_3 = \mathbf{r}_1 + \mathbf{r}_2$$

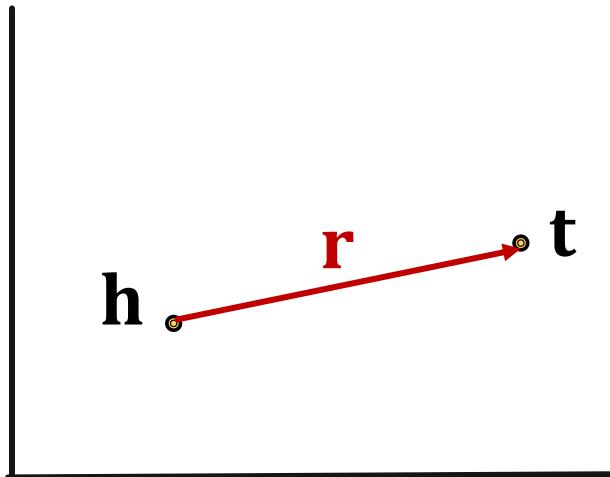

Limitation: Symmetric Relations

- **Symmetric Relations:**

$$r(h, t) \Rightarrow r(t, h) \quad \forall h, t$$

- **Example:** Family, Roommate
- **TransE cannot** model symmetric relations **x**
only if $\mathbf{r} = 0$, $\mathbf{h} = \mathbf{t}$

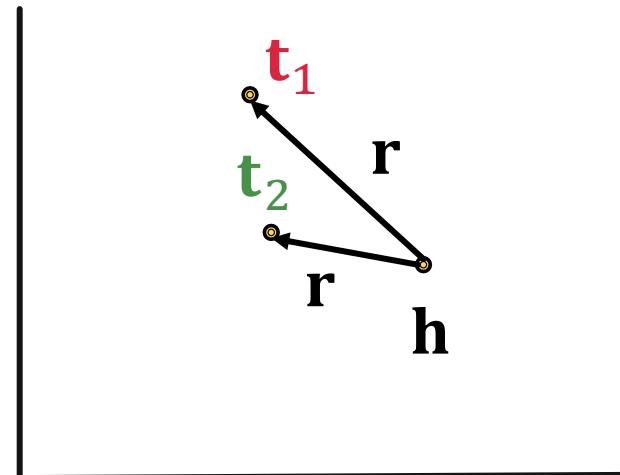

For all h, t that satisfy $r(h, t)$, $r(t, h)$ is also True, which means $\|\mathbf{h} + \mathbf{r} - \mathbf{t}\| = 0$ and $\|\mathbf{t} + \mathbf{r} - \mathbf{h}\| = 0$. Then $\mathbf{r} = 0$ and $\mathbf{h} = \mathbf{t}$, however h and t are two different entities and should be mapped to different locations.

Limitation: 1-to-N Relations

- **1-to-N Relations:**
 - **Example:** (h, r, t_1) and (h, r, t_2) both exist in the knowledge graph, e.g., r is “StudentsOf”
- **TransE cannot** model 1-to-N relations ✗
 - t_1 and t_2 will map to the same vector, although they are different entities

- $t_1 = h + r = t_2$
- $t_1 \neq t_2$ **contradictory!**

Today: KG Completion Models

What we learned so far:

Model	Score	Embedding	Sym.	Antisym.	Inv.	Compos.	1-to-N
TransE	$-\ \mathbf{h} + \mathbf{r} - \mathbf{t}\ $	$\mathbf{h}, \mathbf{t}, \mathbf{r} \in \mathbb{R}^k$	✗	✓	✓	✓	✗

Stanford CS224W: Knowledge Graph Completion: TransR

CS224W: Machine Learning with Graphs

Jure Leskovec, Stanford University

<http://cs224w.stanford.edu>

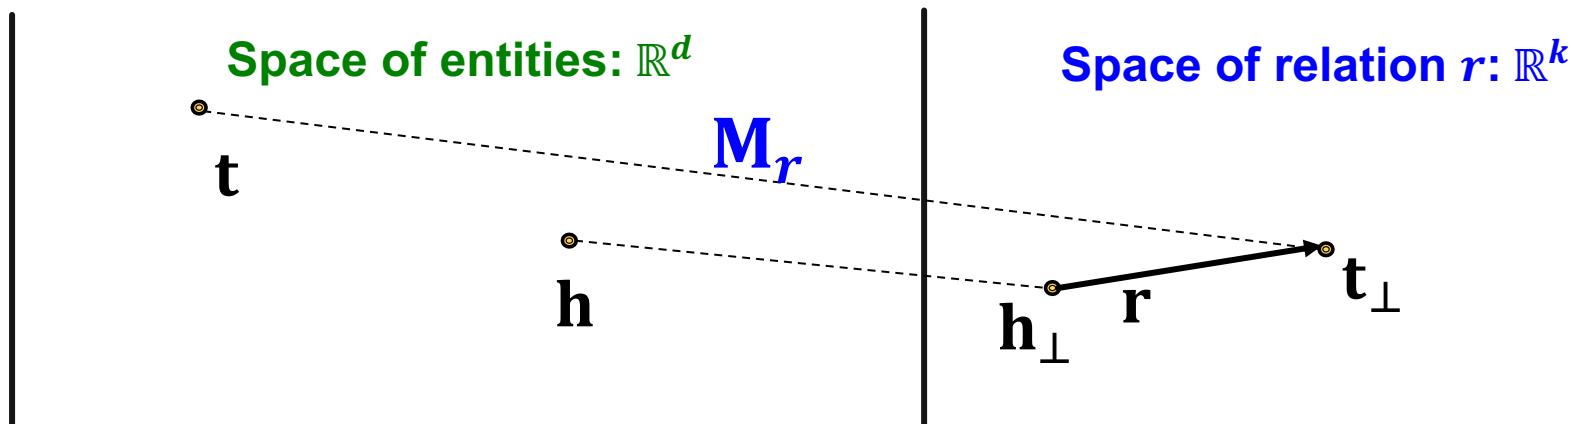

TransR

- TransE models translation of any relation in the **same** embedding space.
- Can we design a new space for each relation and do translation in **relation-specific space**?
- TransR: model **entities** as vectors in the entity space \mathbb{R}^d and model each **relation** as vector in relation space $\mathbf{r} \in \mathbb{R}^k$ with $\mathbf{M}_r \in \mathbb{R}^{k \times d}$ as the projection matrix.

TransR

- TransR: model **entities** as vectors in the entity space \mathbb{R}^d and model each **relation** as vector in relation space $\mathbf{r} \in \mathbb{R}^k$ with $\mathbf{M}_r \in \mathbb{R}^{k \times d}$ as the **projection matrix**.
Use \mathbf{M}_r to **project** from entity space \mathbb{R}^d to relation space \mathbb{R}^k !
- $\mathbf{h}_\perp = \mathbf{M}_r \mathbf{h}, \mathbf{t}_\perp = \mathbf{M}_r \mathbf{t}$
- **Score function:** $f_r(h, t) = -||\mathbf{h}_\perp + \mathbf{r} - \mathbf{t}_\perp||$

Symmetric Relations in TransR

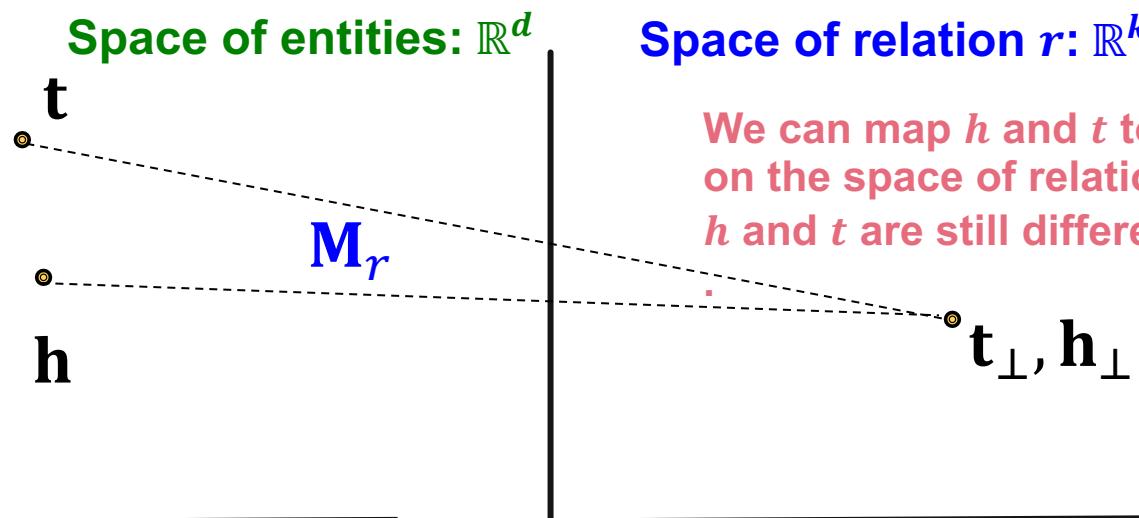

■ Symmetric Relations:

$$r(h, t) \Rightarrow r(t, h) \quad \forall h, t$$

- Example: Family, Roommate
- TransR can model symmetric relations

$$\mathbf{r} = 0, \quad \mathbf{h}_\perp = \mathbf{M}_r \mathbf{h} = \mathbf{M}_r \mathbf{t} = \mathbf{t}_\perp \checkmark$$

Note different symmetric relations may have different \mathbf{M}_r

We can map h and t to the same location on the space of relations r . Then $r = 0$.
 h and t are still different in the entity space,

Antisymmetric Relations in TransR

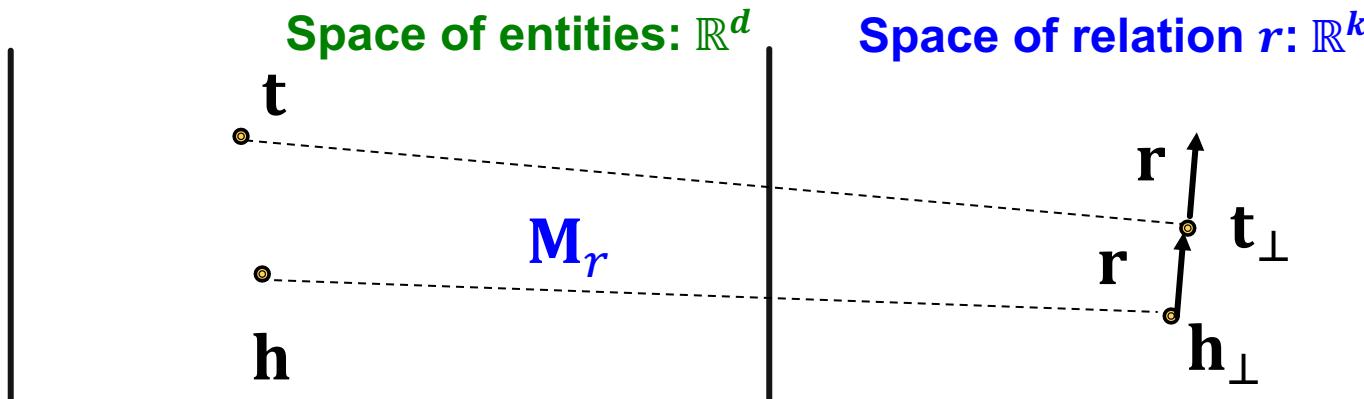

- **Antisymmetric Relations:**

$$r(h, t) \Rightarrow \neg r(t, h) \quad \forall h, t$$

- **Example:** Hyponym
- **TransR** can model antisymmetric relations:

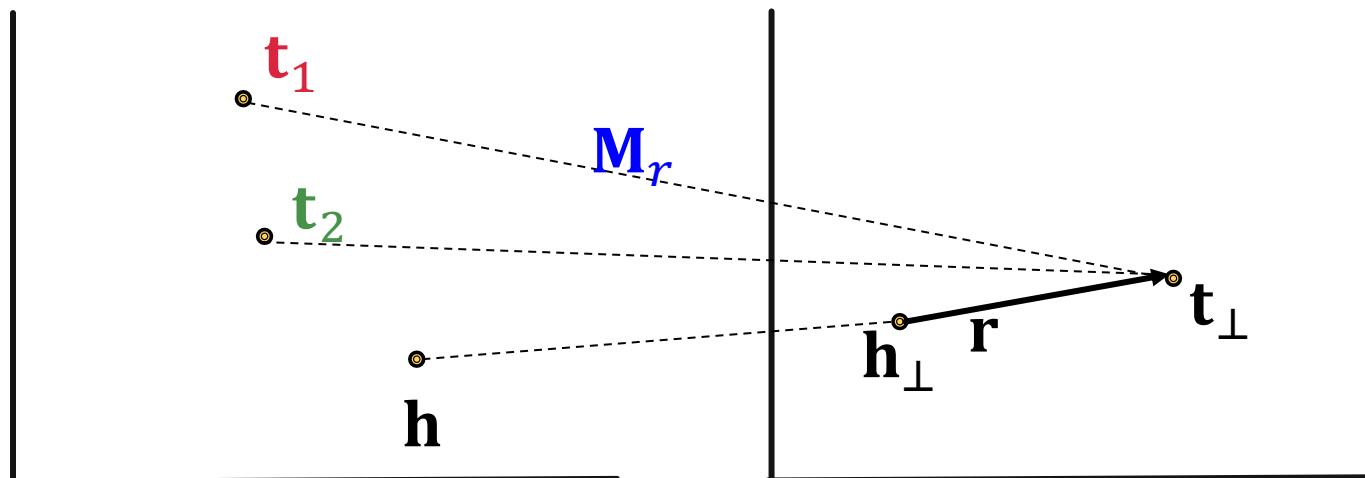

$$\mathbf{r} \neq 0, \mathbf{M}_r \mathbf{h} + \mathbf{r} = \mathbf{M}_r \mathbf{t},$$

Then $\mathbf{M}_r \mathbf{t} + \mathbf{r} \neq \mathbf{M}_r \mathbf{h}$ ✓

1-to-N Relations in TransR

- **1-to-N Relations:**
 - **Example:** If (h, r, t_1) and (h, r, t_2) exist in the knowledge graph.
- **TransR** can model 1-to-N relations ✓
 - We can learn \mathbf{M}_r so that $t_\perp = \mathbf{M}_r t_1 = \mathbf{M}_r t_2$
 - Note that t_1 does not need to be equal to t_2 !

Inverse Relations in TransR

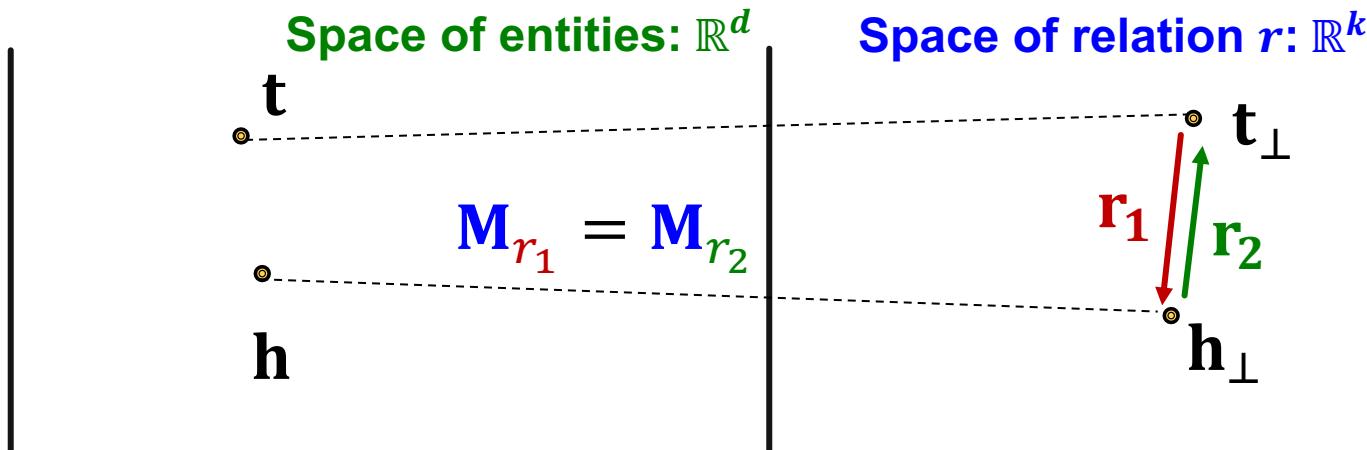

- Inverse Relations:

$$r_2(h, t) \Rightarrow r_1(t, h)$$

- Example : (Advisor, Advisee)
- TransR can model inverse relations

$$r_2 = -r_1, M_{r_1} = M_{r_2}$$

Then $M_{r_1}t + r_1 = M_{r_1}h$ and $M_{r_2}h + r_2 = M_{r_2}t$ ✓

Composition Relations in TransR

- **Composition Relations:**

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

- **Example:** My mother's husband is my father.
- **TransR** can model composition relations

High-level intuition: TransR models a triple with linear functions. Linear functions are chainable!

- If $f(x)$ and $g(x)$ are linear, then $f(g(x))$ is also linear:
 - Let: $f(x)=a \cdot x + b$, $g(x)=c \cdot x + d$: then $f(g(x))= a(c \cdot x + d) + b$.

Composition Relations in TransR

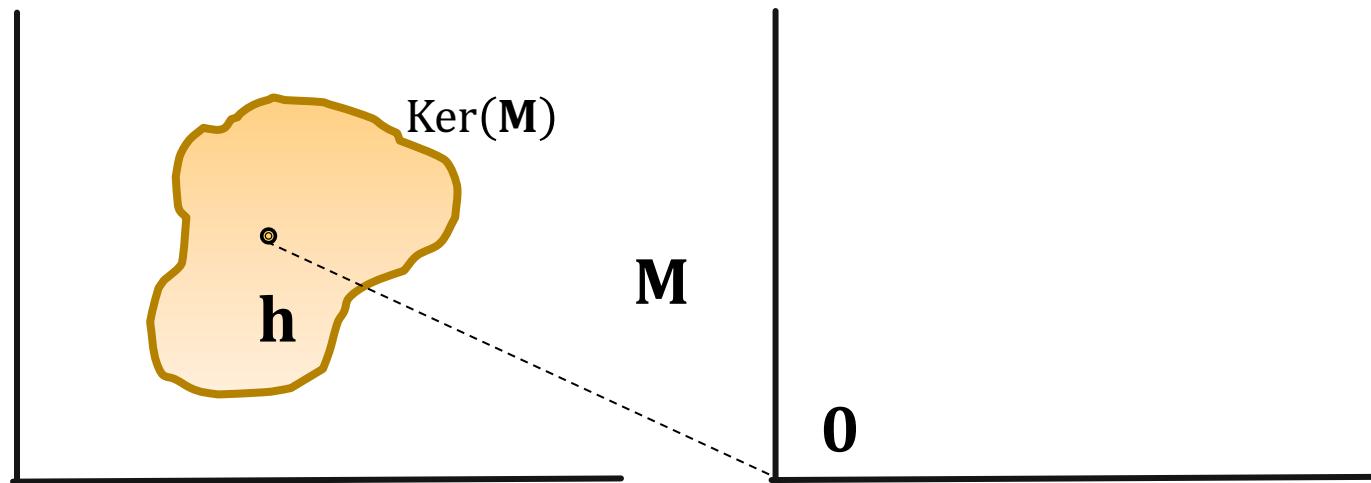

■ Composition Relations:

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

Background:

Def: Kernel space of a matrix \mathbf{M} :

$$\mathbf{h} \in \text{Ker}(\mathbf{M}), \text{ then } \mathbf{M} \cdot \mathbf{h} = \mathbf{0}$$

Composition Relations in TransR

- **Composition Relations:**

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

Assume $\mathbf{M}_{r_1}\mathbf{g}_1 = \mathbf{r}_1$ and $\mathbf{M}_{r_2}\mathbf{g}_2 = \mathbf{r}_2$

- For $r_1(x, y)$:

$$\begin{aligned} r_1(x, y) \text{ exists} &\Rightarrow \mathbf{M}_{r_1}\mathbf{x} + \mathbf{r}_1 = \mathbf{M}_{r_1}\mathbf{y} \Rightarrow \mathbf{M}_{r_1}(\mathbf{y} - \mathbf{x}) = \mathbf{r}_1 \\ \mathbf{y} - \mathbf{x} &\in \mathbf{g}_1 + \text{Ker}(\mathbf{M}_{r_1}) \Rightarrow \mathbf{y} \in \mathbf{x} + \mathbf{g}_1 + \text{Ker}(\mathbf{M}_{r_1}) \end{aligned}$$

- Same for $r_2(y, z)$:

$$\begin{aligned} r_2(y, z) \text{ exists} &\Rightarrow \mathbf{M}_{r_2}\mathbf{y} + \mathbf{r}_2 = \mathbf{M}_{r_2}\mathbf{z} \Rightarrow \\ \mathbf{z} - \mathbf{y} &\in \mathbf{g}_2 + \text{Ker}(\mathbf{M}_{r_2}) \Rightarrow \mathbf{z} \in \mathbf{y} + \mathbf{g}_2 + \text{Ker}(\mathbf{M}_{r_2}) \end{aligned}$$

- Then, we have

$$\mathbf{z} \in \mathbf{x} + \mathbf{g}_1 + \mathbf{g}_2 + \text{Ker}(\mathbf{M}_{r_1}) + \text{Ker}(\mathbf{M}_{r_2})$$

Composition Relations in TransR

- **Composition Relations:**

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

We have $\mathbf{z} \in \mathbf{x} + \mathbf{g}_1 + \mathbf{g}_2 + \text{Ker}(\mathbf{M}_{r_1}) + \text{Ker}(\mathbf{M}_{r_2})$

- Construct \mathbf{M}_{r_3} , s.t.

$$\text{Ker}(\mathbf{M}_{r_3}) = \text{Ker}(\mathbf{M}_{r_1}) + \text{Ker}(\mathbf{M}_{r_2})$$

- **Since:**

- $\dim(\text{Ker}(\mathbf{M}_{r_3})) \geq \dim(\text{Ker}(\mathbf{M}_{r_1}))$

- \mathbf{M}_{r_3} has the same shape as \mathbf{M}_{r_1}

- we know \mathbf{M}_{r_3} exists!

- Set $\mathbf{r}_3 = \mathbf{M}_{r_3}(\mathbf{g}_1 + \mathbf{g}_2)$

- We have $\mathbf{M}_{r_3}\mathbf{x} + \mathbf{r}_3 = \mathbf{M}_{r_3}\mathbf{z}$

Today: KG Completion Models

What we learned so far:

Model	Score	Embedding	Sym.	Antisym.	Inv.	Compos.	1-to-N
TransE	$-\ \mathbf{h} + \mathbf{r} - \mathbf{t}\ $	$\mathbf{h}, \mathbf{t}, \mathbf{r} \in \mathbb{R}^k$	✗	✓	✓	✓	✗
TransR	$-\ M_r \mathbf{h} + \mathbf{r} - M_r \mathbf{t}\ $	$\mathbf{h}, \mathbf{t} \in \mathbb{R}^k,$ $\mathbf{r} \in \mathbb{R}^d,$ $M_r \in \mathbb{R}^{d \times k}$	✓	✓	✓	✓	✓

Stanford CS224W: Knowledge Graph Completion: DistMult

CS224W: Machine Learning with Graphs

Jure Leskovec, Stanford University

<http://cs224w.stanford.edu>

New Idea: Bilinear Modeling

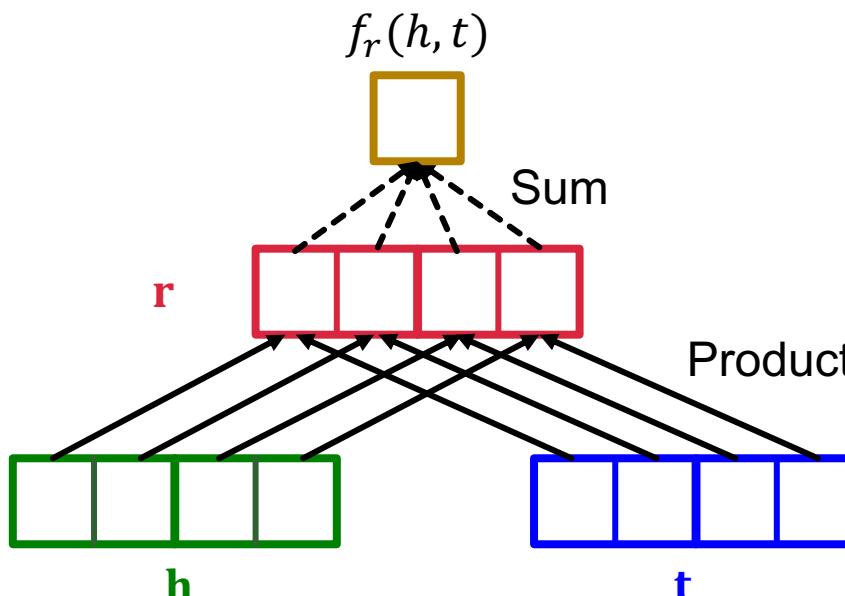

- So far: The scoring function $f_r(h, t)$ is **negative of L1 / L2 distance** in TransE and TransR
- Idea: Use **bilinear** modeling:
Score function: $f_r(h, t) = h \cdot A \cdot t$
 $h, t \in \mathbb{R}^k, A \in \mathbb{R}^{k \times k}$
- Problem: Too general and prone to overfitting
 - Matrix A is too expressive
- Fix: Limit A to be diagonal
 - This is called DistMult

New Idea: Bilinear Modeling

- **DistMult**: Entities & relations are vectors in \mathbb{R}^k
- **Score function:**

$$f_r(h, t) = \langle h, r, t \rangle = \sum_i h_i \cdot r_i \cdot t_i$$

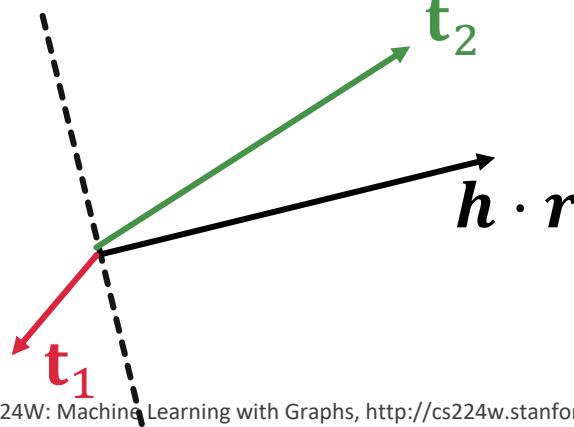

- $h, r, t \in \mathbb{R}^k$

DistMult

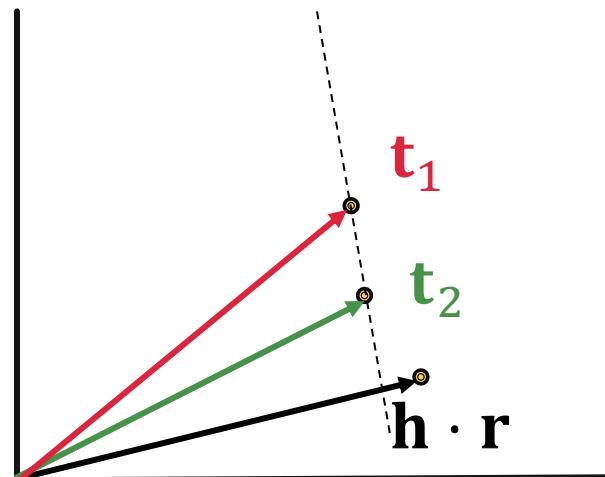

- **DistMult**: Entities and relations using vectors in \mathbb{R}^k
- **Score function**: $f_r(h, t) = \langle h, r, t \rangle = \sum_i h_i \cdot r_i \cdot t_i$
 - $h, r, t \in \mathbb{R}^k$
- **Intuition of the score function**: Can be viewed as a **cosine similarity** between $h \cdot r$ and t
where $h \cdot r$ is defined as $[h \cdot r]_i = h_i \cdot r_i$
- **Example:** Hadamard product

$$f_r(h, t_1) < 0, \quad f_r(h, t_2) > 0$$

1-to-N Relations in DistMult

- **1-to-N Relations:**
 - **Example:** If (h, r, t_1) and (h, r, t_2) exist in the knowledge graph
- **DistMult** can model 1-to-N relations ✓
$$\langle h, r, t_1 \rangle = \langle h, r, t_2 \rangle$$

Symmetric Relations in DistMult

- **Symmetric Relations:**

$$r(h, t) \Rightarrow r(t, h) \quad \forall h, t$$

- **Example:** Family, Roommate
- **DistMult** can naturally model symmetric relations ✓

$$\begin{aligned} f_r(h, t) = < \mathbf{h}, \mathbf{r}, \mathbf{t} > &= \sum_i \mathbf{h}_i \cdot \mathbf{r}_i \cdot \mathbf{t}_i = \\ &< \mathbf{t}, \mathbf{r}, \mathbf{h} > = f_r(t, h) \end{aligned}$$

Due to the commutative property of multiplication.

Limitation: Antisymmetric Relations

- **Antisymmetric Relations:**

$$r(h, t) \Rightarrow \neg r(t, h) \quad \forall h, t$$

- **Example:** Hypernym

- **DistMult cannot** model antisymmetric relations

$$f_r(h, t) = \langle \mathbf{h}, \mathbf{r}, \mathbf{t} \rangle = \langle \mathbf{t}, \mathbf{r}, \mathbf{h} \rangle = f_r(t, h) \times$$

- $r(h, t)$ and $r(t, h)$ always have same score!

DistMult cannot differentiate between head entity and tail entity! This means that all relations are modelled as symmetric regardless, i.e., even anti-symmetric relations will be represented as symmetric.

Limitation: Inverse Relations

- **Inverse Relations:**

$$\textcolor{green}{r}_2(h, t) \Rightarrow \textcolor{red}{r}_1(t, h)$$

- **Example :** (Advisor, Advisee)
- **DistMult cannot** model inverse relations ✗
 - Assume DistMult does model inverse relations:
 $f_{\textcolor{green}{r}_2}(h, t) = \langle \mathbf{h}, \textcolor{green}{r}_2, \mathbf{t} \rangle = \langle \mathbf{t}, \textcolor{red}{r}_1, \mathbf{h} \rangle = f_{\textcolor{red}{r}_1}(t, h)$
 - For example, $\textcolor{green}{r}_2 = \textcolor{red}{r}_1$ solves this (there are also exist solutions $\textcolor{green}{r}_2 \neq \textcolor{red}{r}_1$)
 - But semantically this does not make sense: **The embedding of “Advisor” relation should not be the same as “Advisee” relation.**

Limitation: Composition Relations

- **Composition Relations:**

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

- **Example:** My mother's husband is my father.
- **DistMult cannot** model composition of relations ✗
 - **Intuition:** Because dot product is commutative ($a \cdot b = b \cdot a$) **DistMult** does not distinguish between head and tail entities, so it cannot model composition.

Today: KG Completion Models

What we learned so far:

Model	Score	Embedding	Sym.	Antisym.	Inv.	Compos.	1-to-N
TransE	$-\ \mathbf{h} + \mathbf{r} - \mathbf{t}\ $	$\mathbf{h}, \mathbf{t}, \mathbf{r} \in \mathbb{R}^k$	✗	✓	✓	✓	✗
TransR	$-\ M_r \mathbf{h} + \mathbf{r} - M_r \mathbf{t}\ $	$\mathbf{h}, \mathbf{t} \in \mathbb{R}^k,$ $\mathbf{r} \in \mathbb{R}^d,$ $M_r \in \mathbb{R}^{d \times k}$	✓	✓	✓	✓	✓
DistMult	$\langle \mathbf{h}, \mathbf{r}, \mathbf{t} \rangle$	$\mathbf{h}, \mathbf{t}, \mathbf{r} \in \mathbb{R}^k$	✓	✗	✗	✗	✓

Stanford CS224W: Knowledge Graph Completion: ComplEx

CS224W: Machine Learning with Graphs

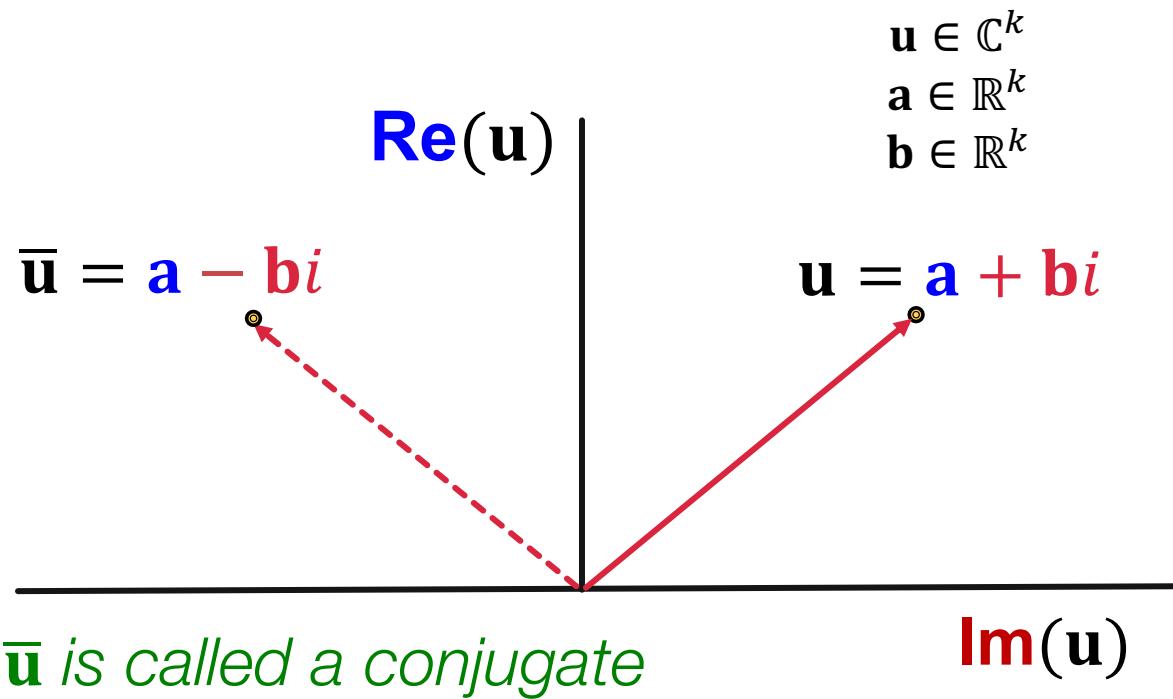

Jure Leskovec, Stanford University

<http://cs224w.stanford.edu>

ComplEx

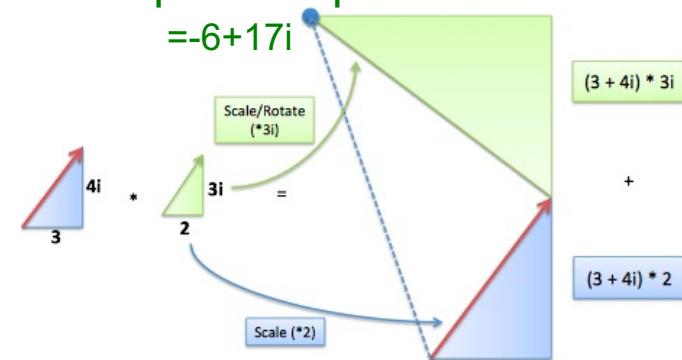

- Based on Distmult, ComplEx embeds entities and relations in **Complex vector space**
- ComplEx: model entities and relations using vectors in \mathbb{C}^k

Complex multiplication:

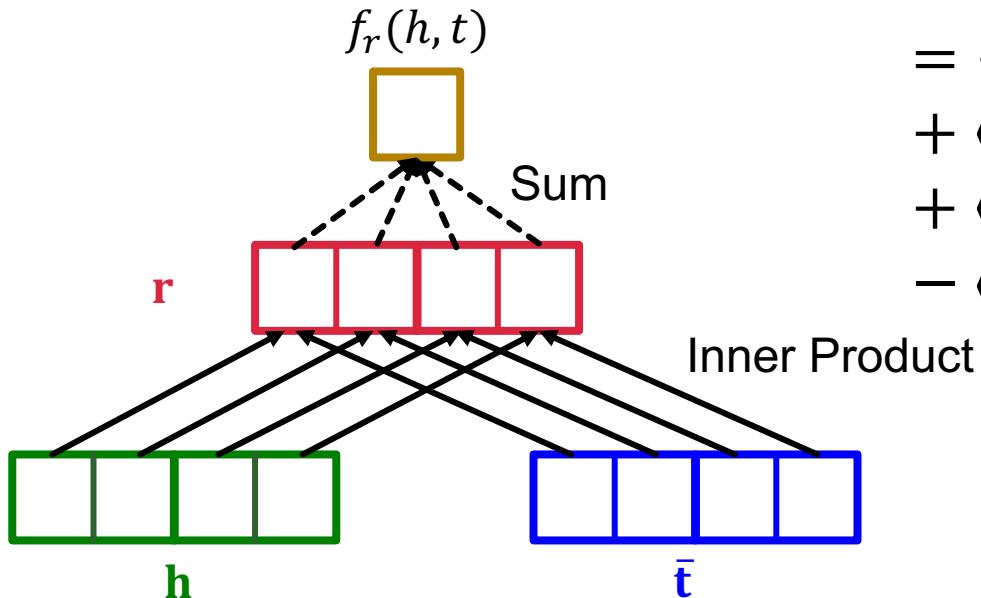

$$(a + ib)(c + id) = (ac - bd) + i(ad + bc)$$

Example multiplication:

ComplEx

- Based on Distmult, ComplEx embeds entities and relations in **Complex vector space**
- ComplEx: model entities and relations using vectors in \mathbb{C}^k
- **Score function** $f_r(h, t) = \text{Re}(\sum_i \mathbf{h}_i \cdot \mathbf{r}_i \cdot \bar{\mathbf{t}}_i)$

$$\begin{aligned} f_r(h, t) &= \langle \text{Re}(\mathbf{h}_i), \text{Re}(\mathbf{r}_i), \text{Re}(\bar{\mathbf{t}}_i) \rangle \\ &+ \langle \text{Re}(\mathbf{h}_i), \text{Im}(\mathbf{r}_i), \text{Im}(\bar{\mathbf{t}}_i) \rangle \\ &+ \langle \text{Im}(\mathbf{h}_i), \text{Re}(\mathbf{r}_i), \text{Im}(\bar{\mathbf{t}}_i) \rangle \\ &- \langle \text{Im}(\mathbf{h}_i), \text{Im}(\mathbf{r}_i), \text{Re}(\bar{\mathbf{t}}_i) \rangle \end{aligned}$$

ComplEx Score Function

$$\begin{aligned} f_r(h, t) &= \operatorname{Re} \left(\sum_i \mathbf{h}_i \cdot \mathbf{r}_i \cdot \bar{\mathbf{t}}_i \right) \\ &= \sum_i \operatorname{Re}(\mathbf{h}_i \cdot \mathbf{r}_i \cdot \bar{\mathbf{t}}_i) \\ &= \sum_i \operatorname{Re}((\operatorname{Re}(\mathbf{h}_i) + i\operatorname{Im}(\mathbf{h}_i)) \cdot (\operatorname{Re}(\mathbf{r}_i) + i\operatorname{Im}(\mathbf{r}_i)) \cdot (\operatorname{Re}(\mathbf{t}_i) - i\operatorname{Im}(\mathbf{t}_i))) \\ &= \sum_i \operatorname{Re}(\mathbf{h}_i)\operatorname{Re}(\mathbf{r}_i)\operatorname{Re}(\mathbf{t}_i) + \operatorname{Re}(\mathbf{h}_i)\operatorname{Im}(\mathbf{r}_i)\operatorname{Im}(\mathbf{t}_i) \\ &\quad + \operatorname{Im}(\mathbf{h}_i)\operatorname{Re}(\mathbf{r}_i)\operatorname{Im}(\mathbf{t}_i) - \operatorname{Im}(\mathbf{h}_i)\operatorname{Im}(\mathbf{r}_i)\operatorname{Re}(\mathbf{t}_i) \\ &= \langle \operatorname{Re}(\mathbf{h}_i), \operatorname{Re}(\mathbf{r}_i), \operatorname{Re}(\mathbf{t}_i) \rangle + \langle \operatorname{Re}(\mathbf{h}_i), \operatorname{Im}(\mathbf{r}_i), \operatorname{Im}(\mathbf{t}_i) \rangle \\ &\quad + \langle \operatorname{Im}(\mathbf{h}_i), \operatorname{Re}(\mathbf{r}_i), \operatorname{Im}(\mathbf{t}_i) \rangle - \langle \operatorname{Im}(\mathbf{h}_i), \operatorname{Im}(\mathbf{r}_i), \operatorname{Re}(\mathbf{t}_i) \rangle \end{aligned}$$

Antisymmetric Relations in ComplEx

- **Antisymmetric Relations:**

$$r(h, t) \Rightarrow \neg r(t, h) \quad \forall h, t$$

- **Example:** Hyponym
 - **ComplEx** can model antisymmetric relations ✓
 - The model is expressive enough to learn
 - **High** $f_r(h, t) = \text{Re}(\sum_i \mathbf{h}_i \cdot \mathbf{r}_i \cdot \bar{\mathbf{t}}_i)$
 - **Low** $f_r(t, h) = \text{Re}(\sum_i \mathbf{t}_i \cdot \mathbf{r}_i \cdot \bar{\mathbf{h}}_i)$
- Due to the asymmetric modeling using complex conjugate.

Symmetric Relations in ComplEx

- **Symmetric Relations:**

$$r(h, t) \Rightarrow r(t, h) \quad \forall h, t$$

- **Example:** Family, Roommate
- **ComplEx** can model symmetric relations ✓

- When $\text{Im}(\mathbf{r}) = 0$, we have

$$\begin{aligned} f_r(h, t) &= \text{Re}(\sum_i \mathbf{h}_i \cdot \mathbf{r}_i \cdot \bar{\mathbf{t}}_i) = \sum_i \text{Re}(\mathbf{r}_i \cdot \mathbf{h}_i \cdot \bar{\mathbf{t}}_i) \\ &= \sum_i \mathbf{r}_i \cdot \text{Re}(\mathbf{h}_i \cdot \bar{\mathbf{t}}_i) = \sum_i \mathbf{r}_i \cdot \text{Re}(\bar{\mathbf{h}}_i \cdot \mathbf{t}_i) = \sum_i \text{Re}(\mathbf{r}_i \cdot \bar{\mathbf{h}}_i \cdot \mathbf{t}_i) \\ &= f_r(t, h) \end{aligned}$$

Inverse Relations in ComplEx

- Inverse Relations:

$$r_2(h, t) \Rightarrow r_1(t, h)$$

- Example : (Advisor, Advisee)
- ComplEx can model inverse relations ✓
 - $r_1 = \bar{r}_2$
 - Complex conjugate of
 $r_2 = \underset{\mathbf{r}}{\operatorname{argmax}} \operatorname{Re}(\langle \mathbf{h}, \mathbf{r}, \bar{\mathbf{t}} \rangle)$ is exactly
 $r_1 = \underset{\mathbf{r}}{\operatorname{argmax}} \operatorname{Re}(\langle \mathbf{t}, \mathbf{r}, \bar{\mathbf{h}} \rangle).$

Composition and 1-to-N

- **Composition Relations:**

$$r_1(x, y) \wedge r_2(y, z) \Rightarrow r_3(x, z) \quad \forall x, y, z$$

- **Example:** My mother's husband is my father.

- **1-to-N Relations:**

- **Example:** If (h, r, t_1) and (h, r, t_2) exist in the knowledge graph
- **ComplEx** share the same property with **DistMult**
 - Cannot model composition relations
 - Can model 1-to-N relations

KG Embeddings in Practice

1. Different KGs may have **drastically different relation patterns!**
2. There is not a general embedding that works for all KGs, use the **table** to select models
3. Try **TransE** for a quick run if the target KG does not have much symmetric relations
4. Then use more expressive models, e.g.,
ComplEx, **RotatE** (**TransE** in Complex space)

Summary of Knowledge Graph

- Link prediction / Graph completion is one of the prominent tasks on knowledge graphs
- Introduce **TransE** / **TransR** / **DistMult** / **ComplEx** models with different embedding space and expressiveness
- **Next:** Reasoning in Knowledge Graphs
